Water Soluble Powder

## فلوکسی۔ این میک

(پانی میں حل پذیر پاؤڈر)

### Composition:

Each gram contains: Neomycin Sulphate..... 150 mg Florfenicol..... 100 mg Oxytetracycline HCl..... 300 mg  
(As per innovator's specifications)

### Enteritis

Necrotic enteritis is caused by intestinal overgrowth of *Clostridium perfringens* Type A and C in young broilers and sometimes laying hens.

**Neomycin Sulphate:** Neomycin belongs to the aminoglycosides group of antibiotics, which functions by inhibiting bacterial protein synthesis, resulting in a bactericidal effect primarily against gram-negative bacteria.

### Salmonellosis

Egg-laying hens may experience reduced egg production or lay eggs with thin or misshapen shells. Diarrhea is a prevalent symptom of *Salmonella* infection in chickens. Affected birds may pass watery feces, sometimes containing blood.

**Florfenicol:** Florfenicol is a broad-spectrum antibiotic that inhibits bacterial protein synthesis by binding to the 50S subunit of the bacterial ribosome, thus preventing peptide bond formation and ultimately leading to bacterial cell death.

### Colibacillosis

Colibacillosis can cause acute fatal septicemia, subacute pericarditis, airsacculitis, salpingitis, peritonitis, and cellulitis.

**Oxytetracycline HCl:** Oxytetracycline HCl, a powerful antibiotic, further enhances the product's capability to address infections. Its inclusion broadens the spectrum of activity, making the medicine effective against a diverse range of susceptible bacteria.
